HEART DISEASE

† † † † †

Today, heart disease is the leading cause of death in the United States. But genealogy may have lead the way to finding a treatment that will reduce the risk of plaque build-up in the arteries resulting in a heart attack.

Some years ago it was noted by doctors that a certain number of people in the village of Limone, Italy seemed to have a longevity much higher than others in the village. Dr. Cesare Sirtori of the University of Milan began a study. He found they were all related one way or another with a common ancestor, a son born to Cristoforo Pomaroli and Rose Giovanelli in 1780.

Today there are 38 of his descendants, from teens to 90 years old, living that carry a mutation gene producing protein of the so called good cholesterol that allows them to eat any fatty food that comes along without problems of artery blockage. The mutation known as Apoliporotein A-1 Milano has been tested by Dr. Prediman K. Shah of Cedars-Sinai Medical Center in rabbits with outstanding success. It still has to have further successful animal testing before it can be tried on humans. If it will work or not is sometime in the future but it is at least a glimmer of light at the end of the clogged arteries that was sparked by Genealogy.
